

MARKETING DASHBOARD

Marketing Dashboard – Looker Studio

Project Description

In this project, a marketing dashboard was recreated using Looker Studio, based on a professional reference design.

The goal was to simulate a real-world digital marketing environment by integrating multiple channels, data sources, and campaigns with key performance metrics.

Objective

To build a dashboard that clearly visualizes marketing performance and supports data-driven decision-making.

Tools Used

- Looker Studio
- Google Sheets / Excel
- Dummy data generation

Dashboard Structure

The dashboard includes the following components:

- **Top-level KPIs**
Cost, CPC, CPM, CTR, impressions, conversions, and conversion rate. Each KPI includes a sparkline to show trends over time and a comparison against a previous period.
- **Channel Performance Table**
Provides a breakdown of performance by channel, helping identify which channels drive volume and which deliver better efficiency.
- **Data Source Performance Table**
Shows performance across platforms such as Google Ads, Facebook, LinkedIn, and others.
- **Campaign Performance Table**
Allows analysis at the campaign level to identify high and low-performing initiatives.
- **Time Series Chart**
Displays how impressions evolve over time across different channels.

Data Generation Approach

The dataset was generated to reflect realistic marketing behavior. Variations were introduced across channels, campaigns, and time to simulate differences in performance, volume, and efficiency.

Key Insights

- Some channels generate higher volumes of impressions but lower efficiency in terms of CTR and conversions.
- Campaign performance varies significantly, highlighting optimization opportunities.
- Time-based analysis helps identify performance spikes and potential anomalies.

Practical Use Case

This dashboard can be used on a daily basis to monitor campaign performance, identify trends, and make quick, data-driven decisions regarding budget allocation and strategy adjustments.
